1. Did your estimations reflect the actual effort?

Mostly, yes - but with some honest uncertainty built in. I gave the foundational stories (creating a trip, adding travellers) low points like 2–3, since they're basic CRUD operations. I gave the currency-conversion and settlement-plan stories the highest points (8 each) because they depend on an external exchange-rate API and a min-flow algorithm, respectively - pieces I haven't actually built yet, so those numbers were as much a measure of uncertainty as of effort. If I were to actually implement these, I'd expect the settlement-graph story to be the one most likely to blow past its estimate, since “minimize total transactions” is an algorithmic problem I haven't scoped in detail.

2. Was your backlog well-prioritized?

For the most part. I set priorities based on dependency order - trip and member management had to come first since nothing else works without a trip existing, so those stories being High priority made sense. Where it got inconsistent was “Remove a Traveler” - I marked it Low priority even though it sits in the same foundational epic, because in practice a group rarely removes someone mid-trip. That's a fair call, but it made me realize priority and epic grouping aren't the same axis: a story doesn't automatically deserve High priority just because it lives in an “important” epic. I'd want to double-check that logic with a teammate rather than deciding it alone.

3. How did your simulated sprint align with your plan?

Less smoothly than I expected. Sprint 1 stayed light - about 13 points across trip setup and the first expense story - which felt like a reasonable, conservative first sprint while getting oriented. But Sprint 2 ended up with the five remaining stories, including both 8-point items, for roughly 27 points total. That's more than double Sprint 1's load, which isn't realistic for a real team, since velocity is supposed to stay roughly consistent sprint over sprint. In hindsight, I should have spread the two heavy stories (currency conversion, settlement plan) across two different sprints instead of stacking them together.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart made the planning issue from question 3 visible instead of just theoretical. Because I left one item in progress rather than moving everything to Done, the remaining-work line didn't reach zero and stayed above the guideline line for the second half of the sprint. That's the same pattern the handout describes as a sign the team took on too much or didn't break a task down enough - in my case, almost certainly the two 8-point stories landing in the same sprint. If this were a real team, I'd use that signal to cap future sprints closer to Sprint 1's -13 points until we have a few sprints of actual, not estimated, velocity data to plan against.
